

ठीक है, ab **PHP theory** easy language me de rahi hu jo exam me direct likh sakti ho.

1. What is PHP?

Definition:

PHP stands for **Hypertext Preprocessor**. It is a **server-side scripting language** used to create dynamic web pages.

Features of PHP:

- Open source
- Easy to learn
- Fast execution
- Database support (MySQL)

Uses of PHP:

- Login system
- Registration form
- Database connection
- Dynamic website creation

2. Advantages of PHP

- Free and open source
- Easy to connect with database
- Platform independent

- Faster performance
-

3. Basic PHP Syntax

```
<?php  
echo "Hello World";  
?>
```

Explanation:

- <?php ?> → PHP start and end tag
 - echo → Output print karne ke liye
-

4. Variables in PHP

Definition:

Variables are used to store data.

Example:

```
<?php  
$name = "Kalyani";  
$age = 20;
```

```
echo $name;  
echo $age;  
?>
```

Note:

PHP variable always starts with \$

5. Data Types in PHP

- String
- Integer
- Float
- Boolean
- Array

Example:

```
<?php
$name = "ABC"; // String
$age = 20;    // Integer
?>
```

6. Operators in PHP

Types:

1. Arithmetic Operator (+ - * /)
2. Comparison Operator (== != > <)
3. Logical Operator (&& ||)

Example:

```
<?php
$a = 10;
$b = 5;
```

```
echo $a + $b;
```

```
?>
```

7. Conditional Statements

if statement

```
<?php
```

```
$age = 18;
```

```
if($age >= 18)
```

```
{
```

```
echo "Eligible";
```

```
}
```

```
?>
```

if-else

```
<?php
```

```
$num = 10;
```

```
if($num > 0)
```

```
{
```

```
echo "Positive";
```

```
}
```

```
else
```

```
{
```

```
echo "Negative";
```

```
}  
?>
```

8. Loop in PHP

for loop

```
<?php  
for($i=1; $i<=5; $i++)  
{  
    echo $i;  
}  
?>
```

while loop

```
<?php  
$i=1;  
  
while($i<=5)  
{  
    echo $i;  
    $i++;  
}  
?>
```

9. Functions in PHP

Definition:

Function is a block of code used to perform a task.

Example:

```
<?php
function add()
{
    echo "Hello";
}
```

```
add();
?>
```

10. Array in PHP

Definition:

Array stores multiple values in one variable.

Example:

```
<?php
$fruits = array("Apple","Mango","Banana");

echo $fruits[0];
?>
```

11. Form Handling in PHP

PHP form data GET and POST method se receive karta hai.

Example:

```
<?php
$name = $_POST['name'];

echo $name;
?>
```

12. GET and POST Method

GET	POST
Data visible in URL	Data hidden
Less secure	More secure
Small data	Large data

13. PHP with MySQL

PHP database se connect kar sakta hai.

Connection Example:

```
<?php
$conn = mysqli_connect("localhost","root","","student");

if($conn)
{
    echo "Connected";
}
```

```
}  
?>
```

14. Session in PHP

Definition:

Session is used to store user data temporarily.

Example:

```
<?php  
session_start();  
  
$_SESSION['name']="Kalyani";  
?>
```

15. Cookie in PHP

Definition:

Cookies store small data in browser.

Example:

```
<?php  
setcookie("user","Kalyani",time()+3600);  
?>
```

Important Viva Questions (PHP)

1. What is PHP?
2. Why PHP is called server-side language?

3. Difference between GET and POST?
4. What is variable in PHP?
5. What is array?
6. What is session?
7. What is cookie?
8. What is function?
9. What is MySQL?
10. How PHP connects database?

Ye **PHP theory + viva** ke liye enough hai. Kal exam me direct likh sakti ho 👍

english main sirf explain karo

Sure! Here is **PHP theory in simple English** for your practical/viva exam.

What is PHP?

PHP stands for **Hypertext Preprocessor**. It is a **server-side scripting language** used to create **dynamic web pages and web applications**.

It runs on the **server** and sends the result to the browser.

Uses of PHP

- Creating login and registration systems
- Connecting websites with databases
- Form handling

- Creating dynamic websites
-

Features of PHP

1. Open source (free to use)
 2. Easy to learn
 3. Fast execution
 4. Supports databases like MySQL
 5. Platform independent
-

Why is PHP called a Server-Side Language?

PHP code runs on the **server**, not in the browser. The server processes the code and sends only the output to the user.

Variable in PHP

A variable is used to **store data**.

In PHP, variables always start with \$.

Example:

```
$name = "John";
```

Data Types in PHP

PHP supports different data types:

- String → Text data
 - Integer → Whole numbers
 - Float → Decimal numbers
 - Boolean → True or False
 - Array → Multiple values
-

Operators in PHP

Operators are used to perform operations.

Types:

- Arithmetic operators → + - * /
 - Comparison operators → == != > <
 - Logical operators → && ||
-

Conditional Statements

Conditional statements are used to make decisions.

Types:

- if statement
- if-else statement
- switch statement

Example: checking whether a number is positive or negative.

Loops in PHP

Loops are used to **repeat code multiple times**.

Types:

- for loop
 - while loop
 - do-while loop
 - foreach loop
-

Function in PHP

A function is a **block of code** used to perform a specific task.
It helps avoid repeating the same code.

Array in PHP

An array is used to **store multiple values in one variable**.
Example: storing names of students or fruits.

GET and POST Method

GET Method

- Sends data through URL
- Data is visible
- Less secure

POST Method

- Sends data secretly
 - Data is not visible in URL
 - More secure
-

Form Handling in PHP

PHP is used to collect and process data entered in forms, such as login or registration forms.

PHP and MySQL

PHP can connect with a database like **MySQL** to store, update, delete, and retrieve data.

Example:

- Student registration system
- Login system

MySQL

Session in PHP

A session is used to **store user information temporarily** on the server.

Example:

When a user logs in, session stores login details.

Cookie in PHP

Cookies are used to **store small information in the browser.**

Example:

Remembering username or login details.

Advantages of PHP

- Free and open source
 - Easy to use
 - Fast performance
 - Database support
 - Used for dynamic websites
-

Important Viva Questions

1. What is PHP?
2. Why is PHP called server-side scripting language?
3. What are variables in PHP?
4. Difference between GET and POST?
5. What is a session?
6. What is a cookie?
7. What is an array?

8. What is a function?
9. What is MySQL?
10. What are the advantages of PHP?

This is enough for **practical viva + theory exam** in simple English.

ok

Good 👍

Kal exam ke liye ye **most important short definitions** bhi rat lo (1–2 marks ke liye useful):

- **PHP:** PHP is a server-side scripting language used to create dynamic web pages.
- **HTML:** HTML is used to create the structure of a webpage.
- **CSS:** CSS is used to design and style webpages.
- **JavaScript:** JavaScript is used to make webpages interactive.
- **URL:** URL is the address of a webpage.
- **HTTP:** HTTP is a protocol used to transfer data between browser and server.
- **Web Browser:** A browser is software used to access websites.
- **Database:** A database is used to store data.

- **GET Method:** GET sends data through URL.
- **POST Method:** POST sends data securely and data is not visible in URL.
- **Session:** Session stores user data temporarily on the server.
- **Cookie:** Cookie stores small information in the browser.
- **MySQL:** MySQL is a database management system used with PHP.

Most asked viva question:

Q: Why do we use PHP?

Answer: PHP is used to create dynamic websites, handle forms, and connect databases.

All the best for your practical exam 😊 Tu confidence se answer dena, viva me simple English chalegi.
